

World Production of Oranges, 2017–2021

Table 1

World Production of Oranges (Including Tangerines) by Country, 2017–2021 (in Thousands of Metric Tons)

Country	2017	2018	2019	2020	2021
Brazil	12,053	13,165	15,482	16,982	18,998
United States	8,562	7,453	9,321	6,349	4,500
China	8,391	4,555	7,397	8,921	7,507
European Union	4,563	4,871	4,989	5,551	6,603
India	8,776	9,091	8,898	9,769	10,806
Mexico	4,898	3,777	2,992	3,878	4,003
Spain	3,325	2,671	2,906	3,287	3,422
Egypt	1,784	2,117	2,453	2,643	2,900

Figure 1

World Orange Production Trends by Country, 2017–2021

Analysis and Interpretation

Table 1 and Figure 1 present world production data for oranges, including tangerines, for eight of the leading producing countries and regions between 2017 and 2021, measured in thousands of metric tons. The table lists exact yearly totals for each country, while the line chart in Figure 1 makes the five-year trend for each producer easy to compare at a glance.

The data shows that Brazil was the world's leading orange producer throughout the period and the only country to grow every single year, rising from 12,053 thousand metric tons in 2017 to 18,998 thousand metric tons in 2021, an increase of nearly 58 percent. India followed a similar upward pattern, growing from 8,776 to 10,806 thousand metric tons despite a slight dip in 2019, while the European Union grew steadily as well, moving from 4,563 to 6,603 thousand metric tons over the five years.

In contrast, the United States shows a clear declining trend, falling from 8,562 thousand metric tons in 2017 to just 4,500 in 2021, a drop of nearly 47 percent, with the steepest decline occurring between 2019 and 2021. China's production was the most volatile of the group, dropping sharply in 2018 before partially recovering, then falling again in 2021. Mexico followed a similar pattern of decline followed by a small recovery, while Spain and Egypt remained comparatively stable, with Egypt showing slow but consistent growth across the entire period.

Overall, the data suggests a shift in global orange production toward Brazil, India, and the European Union, while production in the United States and, to a lesser extent, Mexico has weakened over the same five years. China's inconsistent output suggests that its orange supply may be more sensitive to factors such as weather, disease, or shifting agricultural policy than that of the more stable producers. For any organization that depends on a steady orange supply, these

trends indicate that diversifying sourcing toward the growing producers, rather than relying heavily on the United States or China, would likely reduce supply risk going forward.
